

## SAND and RUBBER TOP UP's

Proactive maintenance of synthetic surfaces at all-weather facilities need to be addressed to optimise the playing conditions of the surface, to help extend the longevity of the pitch and to give the best return on your investment.

### COMMON FACTORS FOR TOP UP's

- Weather / climatic conditions
- Playing conditions / usage of surface

If the all-weather synthetic surface does not have the required sand levels or rubber crumb infill, this will greatly affect both the playing potential and the life of the carpet.

### HOW IT WORKS – “WHAT WE DO”

- The levels are checked and reported to the client
- The fibres are power brushed open to allow the sand/rubber to penetrate the fibres
- The rubber/sand is then added to the correct levels by means of specialist machinery
- The surface is then brushed to the correct levels, ready for playing on

All maintenance regimes are developed in consultation with the client to ensure that their individual requirements are taken into consideration. We at **Protech AllWeather** will be happy to advise the client on the condition of their all-weather facility and if necessary apply the correct levels of sand or rubber top up to return their pitch to a good playing condition.
